

WEBINY CONTROL PANEL (“WCP”)

About WCP:

- Webiny Control Panel (“WCP”) is a SaaS hosted product that controls your Webiny Business or Webiny Enterprise license.
- WCP also provides visibility into your API performance and usage.
- Over time WCP will become your central dashboard for site reliability engineering of your self-hosted Webiny CMS instance.
- To learn more about WCP, please visit:
<https://www.webiny.com/docs/wcp/overview>

WEBINY CONTROL PANEL (WCP)

WCP Onboarding:

- As a **Webiny Enterprise customer** you need to create a WCP account and a project so we can activate all the paid features per your contract.
- Go to <https://app.webiny.com/> and create a new account.
- As part of the account creation you will also create an organization for your team.
- Once you have the account you will be asked to create your first project.

WEBINY CONTROL PANEL (WCP)

Project creation:

- Creating a project consists of 3 steps.
- **In step #1** you will name your project and give it an optional description
- **In step #2** you have 3 commands you need to run to link your self-hosted Webiny CMS instance to the WCP project. Through this link WCP extends the license and the paid-for features get activated.
- **Note:** If you already have an existing Open-source Webiny instance, you can skip the first command, which just creates a new Webiny Open-source project.
- Once you reach **step #3** you can close the window.

WCP: TERMINOLOGY

- **WCP Hierarchy** – Organization> Project A> License; WCP Users; CI/CD Environments
- **Webiny CMS Instance** – A single Webiny CMS project can be deployed into multiple CI/CD environments, like production, development, and so on. Also, each individual developer working on the same project will have one or more of their own deployments. Each individual deployment is called a Webiny CMS instance. So, one Webiny CMS project has one or more instances.
- **Project License** – defines which add-ons and how many Webiny CMS user seats you can have in your Webiny CMS instance.
- **WCP Users** – separate from your Webiny CMS users. You can have as many WCP users as you need, and they are free of charge. WCP users do not have access to your Webiny CMS instances. Webiny CMS instances have their own independent user pools.
- **CI/CD Environments** – different long-lived environments, testing/QA. Same as for WCP users, you can have as many CI/CD environments as you need, and they don't come with any extra cost.
- **Non-production licenses:** All CI/CD environments and personal-development environments get the same license as your production environment and access to all the same paid-for features.

WCP: LIMITS

- Both CI/CD and personal development environments have a soft-cap on the number of API limits their Webiny CMS instance can process within 24h. **This excludes the production environment which is uncapped.**
- The limit is in place as a protection mechanism so the system is not issued since all environments get the same amount of user seats and access to the paid features as the production environment free of charge.
- In case the limit needs to be increased, please contact us.

WCP: SUPPORT

- In case you require any assistance, please reach out either to your Customer Success Manager (CSM) or ping us on the community Slack and we will get you unblocked asap.
